

Installing fonts using home-manager

Whethere you are on [macOS](#) or [NixOS](#), you can install and setup fonts in an unified fashion with [Nix](#) using [home-manager](#).

To do this, add:

```
{
  home.packages = [
    # Fonts
    cascadia-code
  ];

  fonts.fontconfig.enable = true;
}
```

The above installs the [Cascadia Code](#)  font. See [this issue](#)  for details.

Verify on macOS

To confirm that the font was successfully installed on [macOS](#), you can open the “Font Book” app and search for the font. They will have been installed into `$HOME/Library/Fonts/HomeManager` folder.
