

# Modularize our flake using flake-parts

 **TODO: Write this!**

For now, see the code: <https://github.com/juspay/todo-app/pull/9> 

Things to highlight:

- **flake-parts** can be used as lightweight **forAllSystems** alternative
- allows us to split top-level flake.nix into small .nix files
- allows us to define **our own modules** and use them (just like **NixOS** options)
- nuts and bolts:
  - perSystem, and its args (**self'**, etc.)
  - **debug** option and inspecting in repl
