

Simplify Haskell Nix configuration using haskell-flake

 **TODO: Write this!**

For now, see the code: <https://github.com/juspay/todo-app/pull/16>

Things to highlight:

- haskell-flake reduces a bunch of lines to pretty much 1
- whilst still allowing all the things you can do with raw nixpkgs infra
- it can also support other package sets, like horizon
- example projects (since todo-app has empty configuration)
